

ABSTRACT

A container for storing sport balls incorporates a device for testing the playing condition of the balls. The test device is in the form of a disk with a base portion supported within the container and an indicator arm. A ball to be tested is placed into the container where it rests on the indicator arm with a portion of the ball protruding out of the open end of the container. The exposed portion of the ball is pressed against a flat surface. This deflects the indicator arm and provides a visual indication of the playing condition of the ball.
